Devansh Goel

Backend & AI Engineer — Python — TypeScript — Distributed Systems

GitHub: github.com/Devanshgoel-123 X: @0xgoel Email: devanshgoel.dev@gmail.com

Education

BITS Pilani 2022 – 2026

B.E. Electrical and Electronics

Experience

Troves.fi Oct 2025 – Present

Backend Engineer

- Engineered a production-grade **delta-neutral yield strategy** by integrating the **Vesu** lending protocol with **Extended Exchange Perpetuals**, automating borrowing, leveraged trading and position management which achieved approximately **15% annualized yield** while maintaining market-neutral exposure.
- Developed a non-custodial **Dollar Cost Averaging (DCA) Vault** managing over **$25K TVL**, implementing automated deposits, scheduled execution, vault accounting, **NAV calculations, share issuance** reducing manual effort by **95%**.
- Architected automated rebalancing and risk management services that maintained **symmetric hedge ratios** in real time and **dynamically de-risked positions** during volatility spikes, preventing asymmetric exposure and eliminating liquidation risk from leveraged positions during market crashes..
- Extended the **Extended Exchange Python SDK** with typed client models, REST API wrappers which was **adopted team-wide**, eliminating the need for engineers to write one-off integration methods.

LogX Jul 2025 – Sep 2025

Backend Engineer

- Optimized the liquidation engine by redesigning execution workflows for parallel processing and restructuring database interactions to minimize lock contention, reducing liquidation runtime by **33% (18s → 12s)**.
- Architected an internal market operations dashboard with **role-based authentication**, enabling leadership to update market parameters directly through UI, replacing manual script changes and reducing unauthorized-access risk by **98%**.
- Implemented a market surveillance system that flagged **4 markets** with corrupted/misread oracle prices before exploitation, preventing an estimated **$40K** in potential losses from price feed manipulation exploits.
- Developed an automated market-making engine that dynamically adjusted bid-ask spreads and rebalanced positions to continuously provide liquidity for the **LOGX** token, contributing to approximately **20%** growth in trading volume.

Eddy Finance Oct 2024 – Jun 2025

Full Stack Engineer

- Optimized production features for a DeFi platform serving over **1.3M unique wallets** using **NestJS**, **Go** and **Python**; implemented caching strategies that reduced API latency by **40%**.
- Engineered a configurable rewards engine powering a **$200K** incentive campaign across **45 quests**, distributing **$40K** in rewards and driving a **4%** increase in trading volume during the campaign period.
- Developed operational dashboards tracking protocol TVL, trading volume, top wallets and ecosystem metrics, enabling real-time monitoring while reducing manual reporting effort by **70%** and growth analysis time by **40%**.
- Created an AI-powered cross-chain trading assistant enabling full platform control via voice swaps, parameter configuration, and execution, reducing average swap time from **30s to 12s**; used by **100+ beta users**.

Skills

Languages: Python, Go, TypeScript, C++, Rust
Backend: Django, FastAPI, Spring Boot, Node.js, NestJS, REST APIs, GraphQL, WebSockets
Databases: PostgreSQL, SQL, Redis, MongoDB
Frontend: React.js, Next.js, JavaScript, TypeScript
Architecture: Microservices, Distributed Systems, Event-Driven Systems, API Design
Cloud & Infrastructure: AWS, Docker, Kubernetes, Linux, Git
Testing: Jest, Playwright

Achievements

Protocol Labs Fellowship May 2025 – Apr 2026

- Selected for **Cohorts 3 & 4** (**Top 10%**) of the Protocol Labs Fellowship, consistently earning **5/5 impact ratings** for open-source contributions and technical execution.
- Contributed **15+ production pull requests** across distributed systems, SDKs, backend infrastructure, APIs, developer tooling and documentation, collaborating with maintainers through code reviews and design discussions.

Aptos Hackathon Nov 2025

- Built an automated algorithmic trading platform integrating multiple external APIs for market data aggregation, sentiment analysis and trade execution, **winning $2,000**.
- Engineered quantitative trading strategies combining technical indicators, real-time analytics and automated execution pipelines, enabling data-driven trading decisions with minimal manual intervention.

Starknet Hacker Games Apr 2025

- Won **1st Place** in the **Agentic AI Track**, securing **$1,000** among competing AI and blockchain projects.
- Built an **agentic AI assistant** capable of understanding natural voice commands, invoking external tools, executing blockchain transactions and interacting with backend APIs through an autonomous agent workflow.
